Introduction ●0	Technical review	Context & issues	How-to: lasers 000000	How-to: Infrared Devices	Urban attacks	Conclusion
Introd	uction					

- CCTVs have nowadays invaded our cities.
 - One CCTV camera for every 32 people in UK (The Guardian, March 2nd, 2011).

- Presented by politicians as the KEY technology to answer urban security issues.
- In fact, can also be dedicated to citizens' mass surveillance.
 Data are processed by private companies.
- http://www.guardian.co.uk/uk/2011/mar/02/ cctv-cameras-watching-surveillance
- http://owni.fr/2011/12/15/ le-palmares-des-villes-sous-surveillance/

- Do CCTVs really provide security?
 - Equivalently (attacker's perspective), can CCTV be bypassed easily or not?
- In a more wider context (urban guerilla), could Police forces and armies really rely on CCTV network to protect citizens efficiently.
 - Equivalently (attacker's perspective), is is possible to blind one-eyed police and states?

- Critical issues in Europe increasing context of riots and revolution 2.0.
- Alternative issues: is it possible for attackers to access military-like technology for a few euros (e.g. infra-red cameras).

Conclusion

Techniques: Color vs. B/W

Color

Grayscale

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

- Color: better rendering/details, enables color-based identification (blue police car different from red bad guy ferrari).
- B&W: cheaper and much light-sensitive (better resolution in under-lit areas).

Introduction Technical review Context & issues How-to: lasers How-to: Infrared Devices Urban attacks Conclusion

Blooming the camera with the 200mW laser has caused some damages to the camera (some pixels are now off).

What if we use some more powerful lasers?

Is it possible to remotely destroy the camera?

7 Conclusion

The tactical scheme

- A group of attackers want to operate in a given (urban) area, which is under CCTV surveillance.
- They want to evade the detection or identification during a limited period of time.
- The issue is how to combine previous single attacks into a combined one in order to make this area totally blind
 - for example a blind corridor to sneak from one point to another one, or to infiltrate an aera.
- How to do that with a limited number of ressources (human, money...)?
- Just use intelligence and graph theory.

Introduction Technical review Context & issues How-to: lasers How-to: Infrared Devices Urban attacks Conclusion

Intelligence step: get the information

- Use our good friend Google and its minions (maps, streetview...)
- Many dedicated sites provide a huge amount of very detailed information for many areas/cities.

- Westminster city map of CCTVs.
- Let us show a few examples in Paris (paris.sous-surveillance.net and streetview).

Modelling the CCTV Network

- The aim is to model and analyze the visibility connections between CCTVs.
- Use combinatorial optimization problems of the graph theory.
- CCTV networks can be modelled by graphs.
- Nodes of G, denoted $(n_i)_{1 \le i \le N}$ are representing CCTVs.
- Entries of the incidence matrix of G (its edges) are defined by:

$$a_{i,j} = \left\{ egin{array}{cccc} 1 & \mathsf{CCTV} \ i \ ext{is connected by a street to CCTV} \ j \ 0 & ext{otherwise} \end{array}
ight.$$

You can use directed edges to describe the fact that CCTV i is monitoring CCTV j as well.

 Normally, optimized implementation of CCTVs networks should be described by the *vertex cover* problem.

 $\{2,4\}$ is the maximal vertex cover (hemispheric CCTVs case)

 But security hysteria & commercial interests result in mass redundancy of CCTVs

CCTV subnetwork monitoring other CCTVs

- CCTVs monitoring other CCTVs are of critical interest (the first to manage).
- Search for the independent set within the graph or a subgraph (the area of operational interest).

Subset of black vertices represents the independent set

- The general problem is NP-complete (untractable for large graphs; Robson's algorithm in $\mathcal{O}(2^{0.276.n})$).
- Can be solved in polynomial time (heuristics) for small subgraph or partial graphs (local area). Use routines maximum_independent_set and maximum_independent_set of NetworkX.

Introduction Technical review Context & issues How-to: lasers How-to: Infrared Devices Urban attacks Conclusion

Creating blind corridors/areas

- The goal is to create a blind corridor or a blind (local) area.
- The solution is to consider the minimal Spanning tree problem for a partial graph or a subgraph corresponding to the area to manage.

- The general problem has polynomial complexity (Kruskal algorithm in O(M. log₂(N))).
- Equivalently, we can consider the graph matching problem.
- Many other approaches and model at the attackers' disposal (*local clique problem, graph reduction techniques...*). Make just you operational thought precise and use graph theory.

7 Conclusion

Introduction 00	Technical review	Context & issues	How-to: lasers 000000	How-to: Infrared Devices	Urban attacks	Conclusion
Conclu	usion					

- Most CCTVs are very weak regarding our attacks and many other techniques are possible (work under current development)
 - Not only CCTVs :-)
 - The realm of electronics and programming... but also algorithmic.
 - Do electronic and hardware hacking!
- CCTVs may be useful for mind peace but not for real security (at least for existing models).
- Vendors make easy profit by selling weak technology for a very high price.

Decision-makers are already blind.
